

Six operating rigs to accelerate target testing and follow-up across priority areas.

The ongoing 2026 drill program is focused on defining higher-grade corridors and refining the geological model to support an updated mineral resource estimate and the upcoming Pre-Feasibility Study (PFS). Pit optimization work is helping to direct final infill drilling.

GS2659

GS2659 intersected 206.3 m at 1.72 g/t Au from 532.5 m, including 160.6 m at 1.80 g/t Au from 578.2 m. Within that interval, drilling returned 9.2 m at 19.33 g/t Au from 694.0 m.

The broad higher-grade zone is interpreted as the downdip extension of the historic Cleary Hill Mine system.

Drilling at Cleary is improving definition within preliminary pit concepts while continuing to test and extend higher-grade mineralization below the historical workings.
